

CLEANING LABORATORY EVALUATION SUMMARY

SCL #: 2002
 DateRun: 08/26/2002
 Experimenters: Jason Marshall
 ClientType: Chemical Company
 ProjectNumber: Project #1
 Substrates: Aluminum
 PartType: Coupon
 Contaminants: Coatings, Resins/Rosins, Solvent
 Cleaning Methods: Ultrasonics
 Analytical Methods: Gravimetric
 Purpose: To evaluate past successful cleaners on new contaminant

Experimental Procedure: The four successful products from the previous trial were again used at full strength and room temperature. An additional product was added to the trial for comparative purposes. All five products were used in 600 ml beakers and degassed for 5 minutes in a Crest 40 kHz ultrasonic tank. Fifteen preweighed coupons were coated with Emerson & Cuming Eccocoat CC 40A Solvent based conductive coating (7440-22-4, 108-88-3, thermoplastic resin) using a hand held swab. Coupons were allowed to sit for 20 minutes and then weighed again. Three coupons were cleaned in each beaker for 5 minutes using ultrasonics. Coupons were rinsed for 15 seconds in a tap water bath at 68 F and dried for 2 minutes using air knives also at 68 F. Once dried, final weights were recorded and efficiencies calculated for each cleaner.

Results: Only two products, both Bio Chem Systems products, removed the contaminant from the coupons. The table lists the efficiencies for each coupon cleaned.
