

CLEANING LABORATORY EVALUATION SUMMARY

SCL #: 24
 DateRun: 09/05/2024
 Experimenters: Rachael Rososky
 ClientType: Cleaner Manufacturer
 ProjectNumber: Project #2
 Substrates: Stainless Steel
 PartType: Coupon
 Contaminants: Oil
 Cleaning Methods:
 Analytical Methods: Visual

Purpose: Observe if contact time of GeoProX affects the efficacy of the cleaner on biofouling.

Experimental Procedure: GeoProX was mixed with water with a ratio of 1.5 grams per 100 mL of water. Two 500 mL beakers were filled with 200 mL of GeoProX mixture (3 grams of GeoProX powder per beaker. Both beakers were put on hot plates with no heat and set to 500 rpm to prevent mixture from separating. All six coupons were immersed in the GeoProX mixture (three white coupons in one beaker and three blue coupons in another). The coupons were visually rated for biofouling after 1 minute, 5 minutes, 10 minutes, 15 minutes, and 20 minutes. Visual ratings are as follows: 1 = no biofouling, 2 = slight biofouling, 3 = noticeable biofouling, 4 = considerable biofouling, 5 = severe biofouling.

Results:

Visual Rating		1	5	10	15	20
Substrate	Coupon #	minute	minutes	minutes	minutes	minutes
A	6	4.5	4.5	4.5	4	4
A	7	4.5	4.5	4.5	4	4
A	8	4.5	4.5	4.5	4	4
B	9	2	2	1.5	1.5	1.5
B	10	2	2	1.5	1.5	1.5
B	11	2	2	1.5	1.5	1.5

Summary:

Conclusion: Cleaner was not effective at removing the soil. The final weights from gravimetric analysis were greater than the initial weights, so this data was omitted. The discrepancy could be due to the cleaner leaving a slight film on the coupon. The cleaner was not miscible with water and it was difficult to keep the mixture from separating. The cleaner eroded the paint off the coupons slightly.
