

# CLEANING LABORATORY EVALUATION SUMMARY

SCL #: 2006  
 DateRun: 12/08/2006  
 Experimenters: Jason Marshall  
 ClientType: Lab  
 ProjectNumber: Project #1  
 Substrates: Aluminum  
 PartType: Coupon  
 Contaminants: Greases, Dirt, Oil  
 Cleaning Methods: Low Pressure Spray  
 Analytical Methods: Gravimetric

Purpose: Laboratory evaluations of alternative aerosol cleaning products

Experimental Procedure: Basic cleaning performance testing was conducted using ASTM G122 as the bases for cleaning. Six products were selected for testing based on previous testing on the selected soil. All products were diluted to 10% using DI water and 500 mls were poured into the EnviroCaddie aerosol spray system and pressurized to just under 95 psi using Nitrogen. Eighteen preweighed aluminum coupons were coated with a collection of brake/engine soil collected from an automobile shop. The coupons were allowed to sit for one day before a second weight was recorded. Three coupons were cleaned with each solution for 30 seconds via the aerosol spray system. Coupons were not rinsed and were air dried at room temperature for 5 minutes. Following drying, final weights were recorded and cleaning efficiencies were calculated.

Results: All six products removed over 80% of the oil-grease-dirt mix using the EnviroCaddie aerosol system. One product, Phase III California Parts Washer removed just under 95%. The Sea Wash Blue had the smallest flow pattern making cleaning slightly more difficult. The table below lists the amount of soil applied, the amount remaining and the efficiency for each coupon cleaned.

Conclusion:

The aqueous based products showed positive results for aerosol cleaning using an EnviroCaddie System. These products may require slightly longer cleaning times to achieve comparable results to the solvent-based aerosol cleaners. It also was noted that the sprayed solution could be collected, filtered and then reused in the EnviroCaddie.
