

CLEANING LABORATORY EVALUATION SUMMARY

SCL #: 2008
 DateRun: 10/10/2008
 Experimenters: Jason Marshall
 ClientType: Electronics Manufacturer
 ProjectNumber: Project #1
 Substrates: Aluminum
 PartType: Coupon
 Contaminants: Cutting/Tapping Fluids
 Cleaning Methods: Immersion/Soak
 Analytical Methods: Gravimetric

Purpose: To evaluate top performing products on fourth supplied contaminant using immersion cleaning.

Experimental Procedure: The top five products based on past testing results were again diluted to 5% using DI water in 400 ml beakers. All five products were heated to 130 F on a hot plate. Peweighed aluminum coupons were coated with the Hagsterfer's Hard Cut 5318 cutting oil using a handheld swab. The contaminant was allowed to dry for about 10 minutes. Once dry, the coupons were weighed a second time to determine the amount of oil applied.

Three coupons were immersed into each solution and cleaned for 5 minutes using stir-bar agitation. Rinsing was performed for 15 seconds using tap water heated to 120 F and followed by 30 seconds of air blow off with dry compressed air at room temperature. Final weights were recorded, and efficiencies were calculated for each coupon cleaned.

Results: Not all of the products were effective at removing the cutting oil from the aluminum coupons within 5 minutes of immersion cleaning. Three of the five removed over 80% of the cutting fluid. The other two removed between 70 and 75%. The table lists the amount of soil added, the amount remaining and the efficiency for each coupon cleaned.
