

# CLEANING LABORATORY EVALUATION SUMMARY

SCL #: 2005

DateRun: 08/09/2005

Experimenters: Jason Marshall

ClientType: Metal Finishing

ProjectNumber: Project #1

Substrates: Brass

PartType: Part

Contaminants: Buffing/Polishing Compounds

Cleaning Methods: Immersion/Soak

Analytical Methods: Photography, Visual

Purpose: To evaluate successful cleaners on supplied parts

Experimental Procedure: Three products from the previous trial were selected based on their high efficiency removing the various buffing compounds. Each product, Ensolv, CCA and Lenium ES were poured into 250 ml glass beakers and placed on a magnetic stir-plate. Six brass parts presoiled with the brown buffing compound were photographed to establish the baseline level of contamination. Two parts were immersed into each solution and cleaned for 5 minutes at room temperature. Following cleaning, parts were photographed again and observations were made.

Results: Each of the three solutions removed some of the buffing compound in the five minutes of room temperature cleaning. During cleaning each cleaning product had black pieces of the buffing compound floating in it. Photos show the dirty and cleaned parts.

Summary:

<b>Substrates:</b>	Brass				
<b>Contaminants:</b>	Buffing/Polishing Compounds				
<b>Company Name:</b>	<b>Product Name:</b>	<b>Conc.:</b>	<b>Efficiency:</b>	<b>Effective:</b>	<b>Observations:</b>
Enviro Tech International Inc	Ensolv	100		<input checked="" type="checkbox"/>	
DuPont	Vertrel CCA	100		<input checked="" type="checkbox"/>	
Petroferm Inc	Lenium ES	100		<input checked="" type="checkbox"/>	

Conclusion: The three products would be more effective if tested at an elevated temperature.
